AffordabLe Lightweight Automobiles AlliaNCE

## Mass Manager Software Tool (WP1.3)

Neil McGregor / Ricardo UK

## Motivation & Objectives

- Management and reduction of complete vehicle mass is challenging ('000s of parts, modules, systems)
- Achieving a complete vehicle mass target requires optimization of many parts – the question is “which parts”, “how much mass”, “how can lightweight parts (and their technologies) be *scaled* from one vehicle to another?”
- Mass Manager is a complete vehicle Bill Of Materials data manager, encompassing statistical mass benchmarking tools, lightweight technology database and optimiser

# Mass Manager Software Tool Overview

## Benchmark

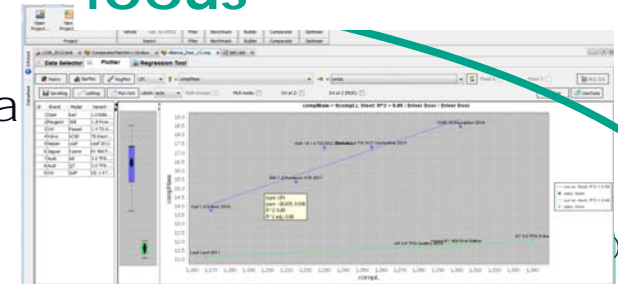

- Complete vehicle BoM analysis & alignment
- Competitor mass benchmarking
- Identify heaviest (target) components in vehicle
- Support “why heavy” process

Alliance WP1.3 focus

## Comparator

- Statistical analysis of benchmark BoM data
- Identify “should weigh” mass targets
- Scalability and transferability function

## Builder

- Single vehicle mass reduction study
- Lightweight technology use-case database
- Vehicle level cost vs mass vs performance
- In-built optimiser

- Rapid, efficient complete vehicle mass analysis and diagnostics
- Evaluation and optimisation of lightweight technologies at complete vehicle level

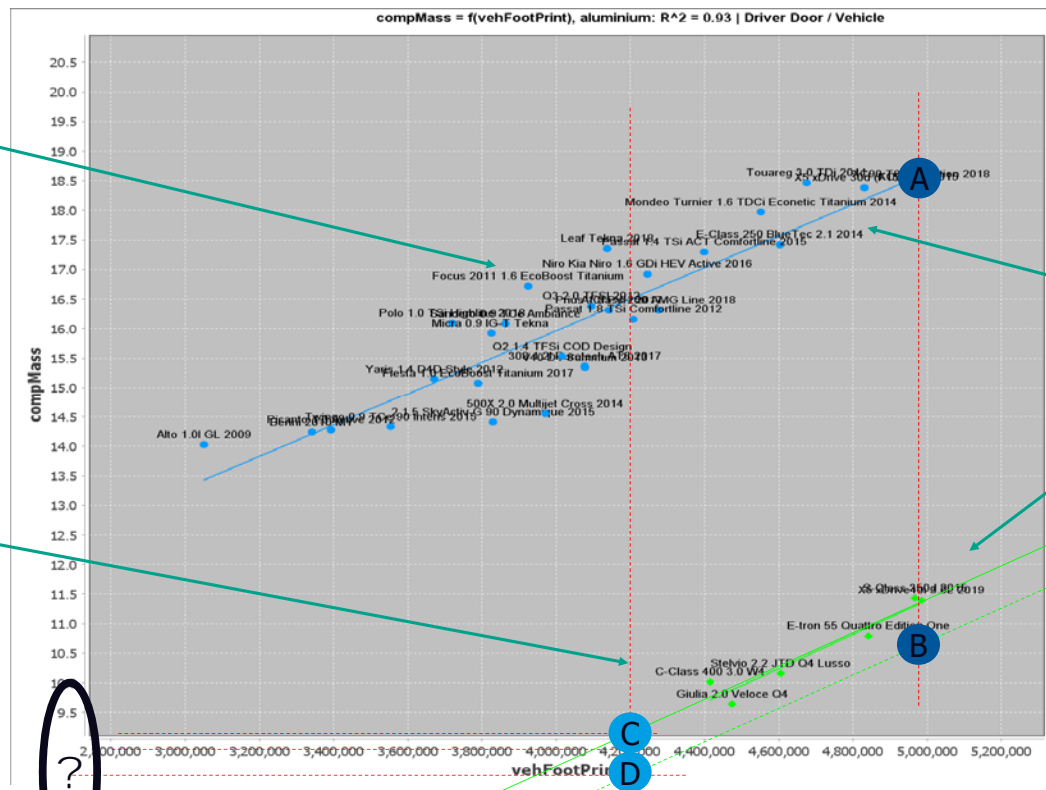

# Mass Manager, example of scalability function

- Example for **scaling** lightweight, aluminium front door concept, developed on **XC90** and applied to VW Golf (reference vehicle)

Steel door benchmark dataset (from a2mac1)

aluminium door benchmark dataset (from a2mac1)

Estimated reference door mass with scaled technology from XC90 lightweight = **8.5kg**

- A XC90 steel door 😊
- B Alliance alum door (XC90) 😊
- C Estimated Reference
- D vehicle door mass

Statistical regression relationship, door mass versus (vehicle footprint m<sup>2</sup>)

**Volvo Cars Door Structure**

Reference

Material: Steel  
 Manufacturing: 11,044 kg  
 Mass: 24,874 kg CO<sub>2</sub>-eq  
 Cost: 31,89 €

Lightweight Demonstrator

Material: Aluminium  
 Manufacturing: 11,067 kg  
 Mass: 114.33 kg CO<sub>2</sub>-eq  
 Cost: 16,97 €

Δ -4,637 kg (-29.44%)  
 Δ -13,333 kg CO<sub>2</sub>-eq (-56.5%)  
 Δ -14,917 € (-46.8%)

# Mass Manager, example of *scalability* function

Volvo XC90

|                        | Steel   | Aluminium | Delta % |
|------------------------|---------|-----------|---------|
| Mass (kg)              | 19.649  | 11.675    | -40.5%  |
| Cost (€)               | 39.50   | 95.97     | +242%   |
| GWP CO <sub>2</sub> kg | 346.874 | 194.33    | -44.0%  |

Alliance reference Vehicle

|                        | Steel      | Aluminium | Delta % |
|------------------------|------------|-----------|---------|
| Mass (kg)              | 15.768     | 8.5       | -32.8%  |
| Cost (€)               | 47.91 (*1) | 87.13     | +182%   |
| GWP CO <sub>2</sub> kg | 283 (*2)   | 176.43    | -37.7%  |

Volvo Cars Door Structure

Reference

Material: Steel  
 Manufacturing: Deepdrawing  
 Mass: 15.644 kg  
 GWP (WLTP): 346.874 kg CO<sub>2</sub>-eq  
 Cost: 39.50 €\*

Lightweight Demonstrator

Material: Aluminium  
 Manufacturing: Deepdrawing  
 Mass: 11.007 kg  
 GWP (WLTP): 194.33 kg CO<sub>2</sub>-eq  
 Cost: 95.97 €

kg -4.637 kg  
 Δ -29.64 %  
 CO<sub>2</sub> -153 kg CO<sub>2</sub>-eq  
 Δ -56 %  
 € +12.18 €/kg

\* Cost data based on WPI calculations

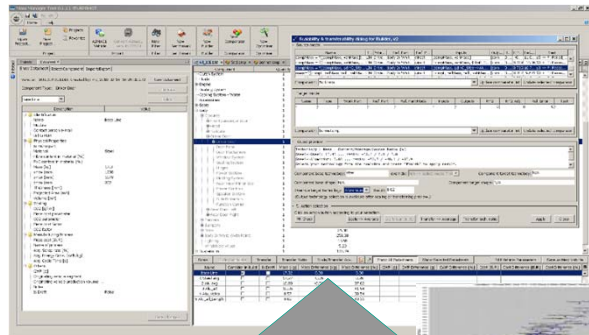

- Mass Manager *scalability* function enabled the estimation of Reference vehicle performance (mass, cost, GWP) based on Volvo XC90 performance and a statistical dataset

\*2: Data source: calculated by Unifi

# Mass Manager, Use Case Database in “Builder” Tool

## Lightweight Vehicle Builder Tool

Weight reduction of existing vehicle or develop new/cleansheet vehicle

Technologies can be *scaled* or *transformed* from and to different vehicle/components using the regression functions identified in Comparator tool

### Use Case Database (lightweighting technologies)

Data stored in MM database for each technology:

- Weight saving (kg)
- Cost £
- GWP (g/CO<sub>2</sub>)
- Performance risks (NVH, safety, repair...)
- Component requirements

- Total vehicle weight saving potential and breakdown

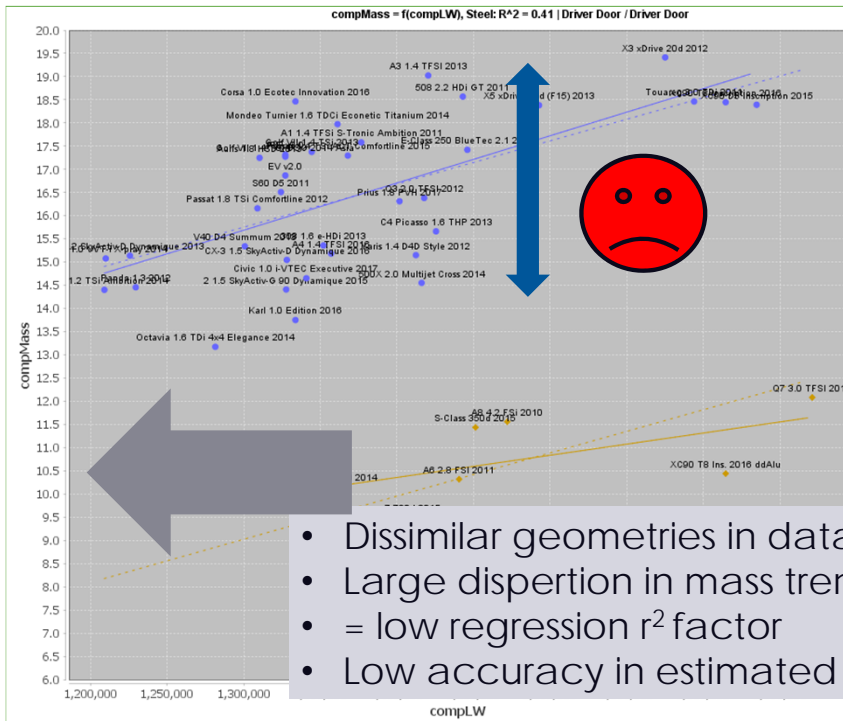

- Potential impact on cost and vehicle performance
- Updated Vehicle BoM

### Key Benefits

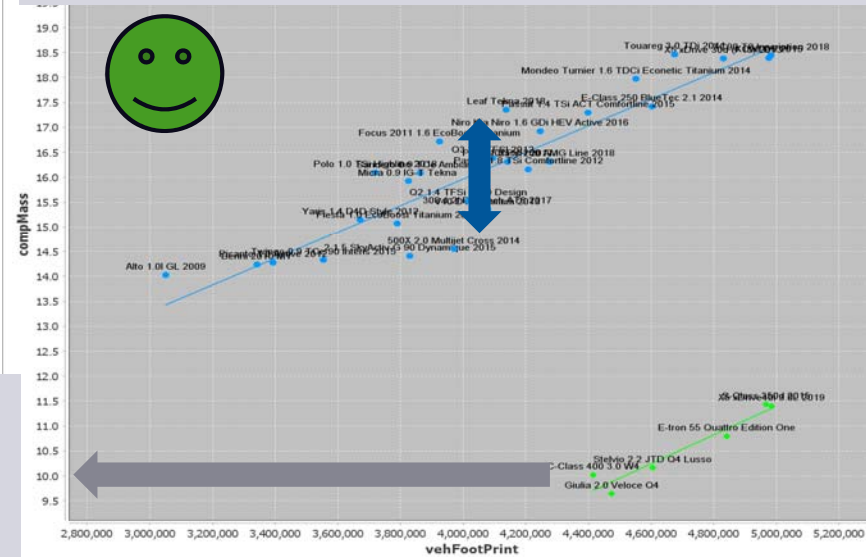

- Complete vehicle weight management at all vehicle development phases
- Rapidly apply and assess lightweight technologies and effects at complete vehicle level
- Central knowledge / database

# Lessons learnt – scalability results are only as good as the quality of the statistical dataset

- Dissimilar geometries in dataset
- Large dispersion in mass trends
- = low regression  $r^2$  factor
- Low accuracy in estimated part mass

- Comparable geometries in dataset
- Low dispersion/variation
- High regression  $r^2$  factor  $\sim 1.0$
- High accuracy in estimated part mass

- Throughout the project we have “learned” which dimension parameters are best/appropriate to use for different components

# Lessons learnt – scalability results are only as good as the quality of the statistical dataset

- a2mac1 provides a good data sample but not for every vehicle segment (trucks, low number of Evs)
- a2mac1 provides mass and dimension at module level (e.g. no breakdown for BIW, therefore difficult to assess Toyota spare wheel module in Mass Manager)
- Requirement to calculate cost and GWP data for statistical benchmark vehicles (time consuming but idea is to create a robust database)
- Difficult to get *Transferability* methodology to give robust results (only when considering parts with similar performance requirements)

Thank you !
